

SkinKit magnet sheet: how to use it

For US Letter paper (8.5 x 11 in). The other side is the pattern.

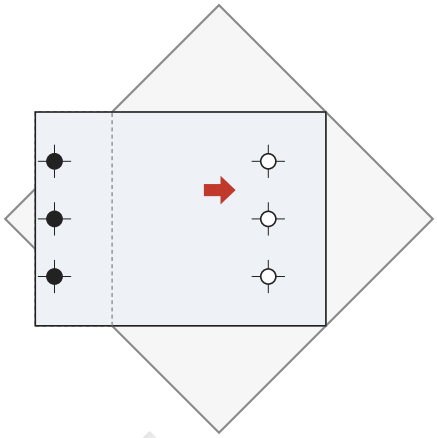

LETTER SIZE (8.5 x 11 in)
PRINT AT 100% / ACTUAL SIZE
Not "Fit to page". Check the rulers below.

1. Make a second Letter-size sheet of skin cloth, the same way as the first. Keep it whole and cover it with double-sided tape.
2. Lay it over the pattern side of this sheet. Skin cloth is see-through, so the pattern shows. Tape all four edges down with masking or washi tape so nothing slides. The pattern leaves a 2 cm border, because the edges of a sheet often get damaged.
3. Put a magnet on every dot with tweezers. Black dots: all one face up. White dots: all flipped, so the pole is opposite. Which face is N does not matter, but keep it the same on every piece.
4. Cut out the pieces along the solid lines, through the skin cloth and the paper together. The paper keeps the lines visible and the skin cloth flat. Then peel the paper off the back.
5. Stick each piece on its diamond as shown below (real size: you can hold a diamond against it). Red arrows point the way the signal flows.

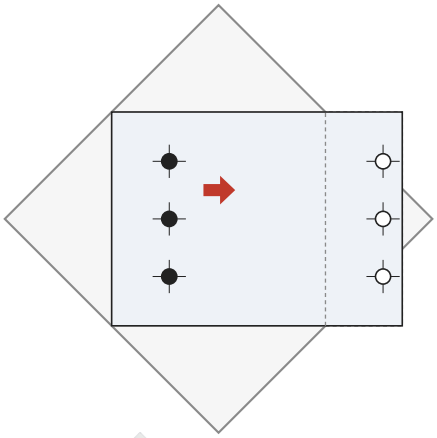

Where each piece goes (real size)

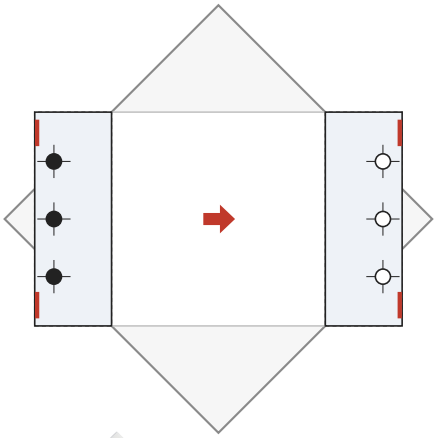

Flat
Flat piece: covers the inner square. Black side at the input end.

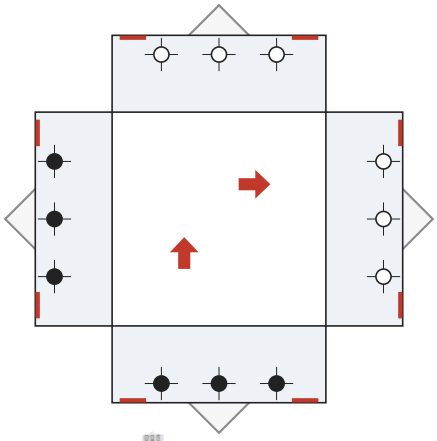

Flap-in
Flap-in piece: the flap part goes on the flap (dashed line = fold), the rest on the inner square.

Flap-out
Flap-out piece: the square part on the inner square, the flap part on the flap at the output end.

Double flaps
2 flap strips: black on the input flap, white on the output flap. Red edge at the flap tip.

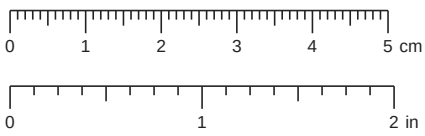

Cross
4 flap strips, one per arm, red edge at the tip. Black on the input arms, white on the output arms.

Key

- magnet, one face up
- magnet, flipped
- flap folds here
- flap tip (dots 2.54 mm from it)
- signal direction

Inner square 28.28 mm (diamond with 40 mm sides). Flap 10.16 x 28.28 mm. Magnets 2 mm, 7.62 mm (0.3 in) apart, like on a circuit module.

Scale check

What is on the pattern side: 8 rows like this one, so 8 of each wire module type
